

Figure S1: Maximum likelihood estimates of the regional speciation ( $s$ ), extinction ( $x$ ), and range expansion ( $d$ ) GeoSSE model parameters.

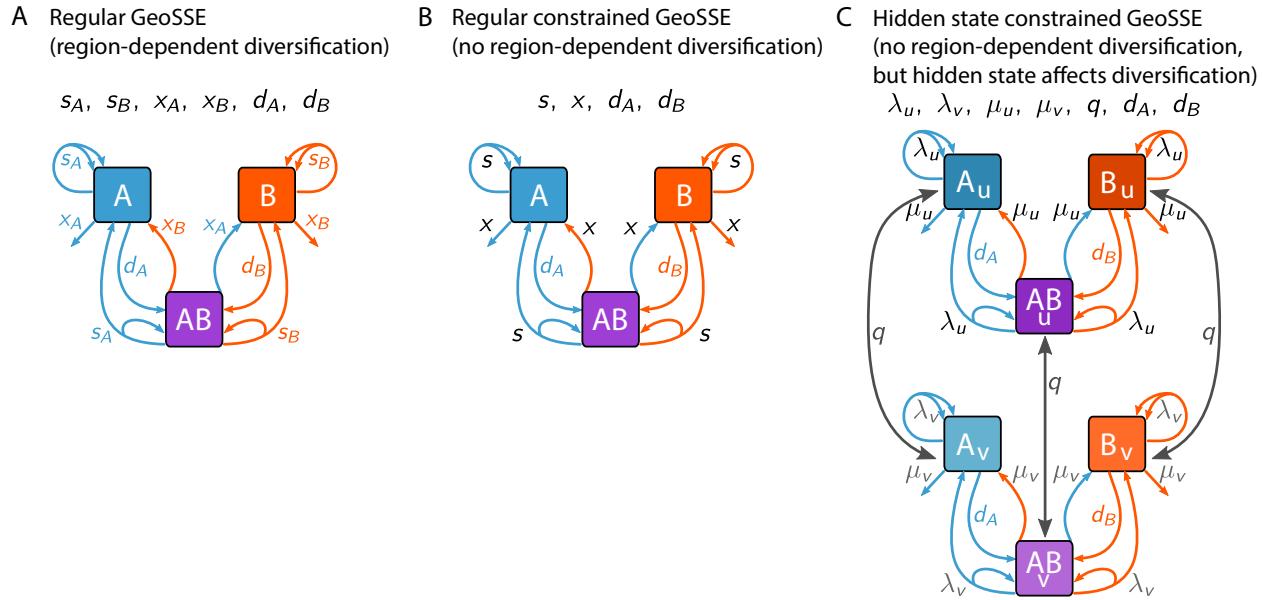

Figure S2: Schematic summary showing transitions among the geographic states induced by processes in the GeoSSE and character-independent-models.

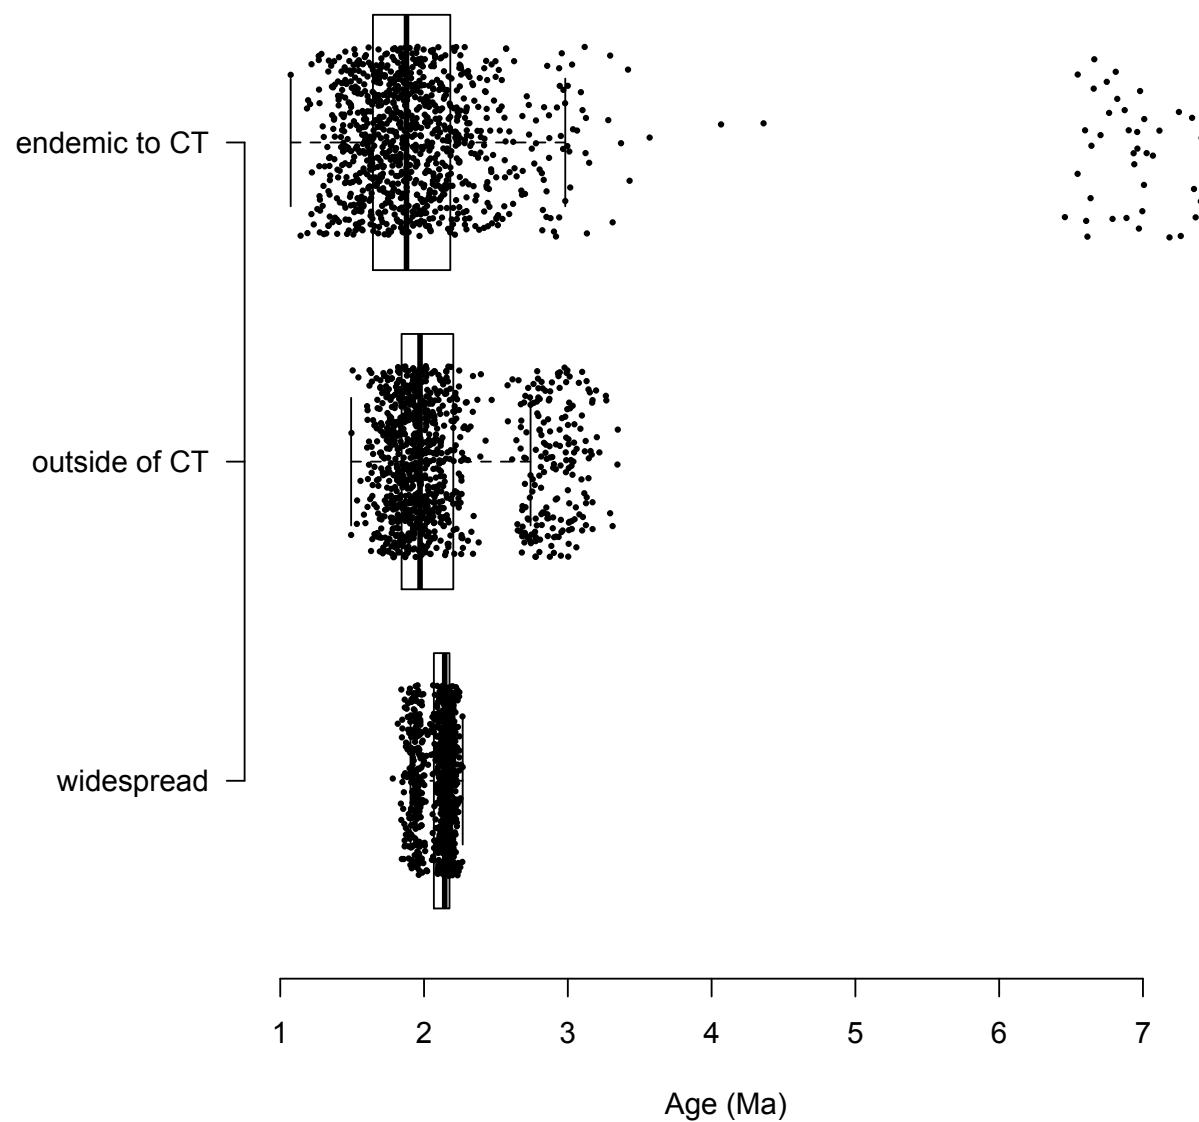

Figure S3: Species ages based on phylogenetic tip length of CT, non-CT, and widespread species for shuffled geographic states with the same tip frequencies as Hughes et al. (2013) (analysis #8).

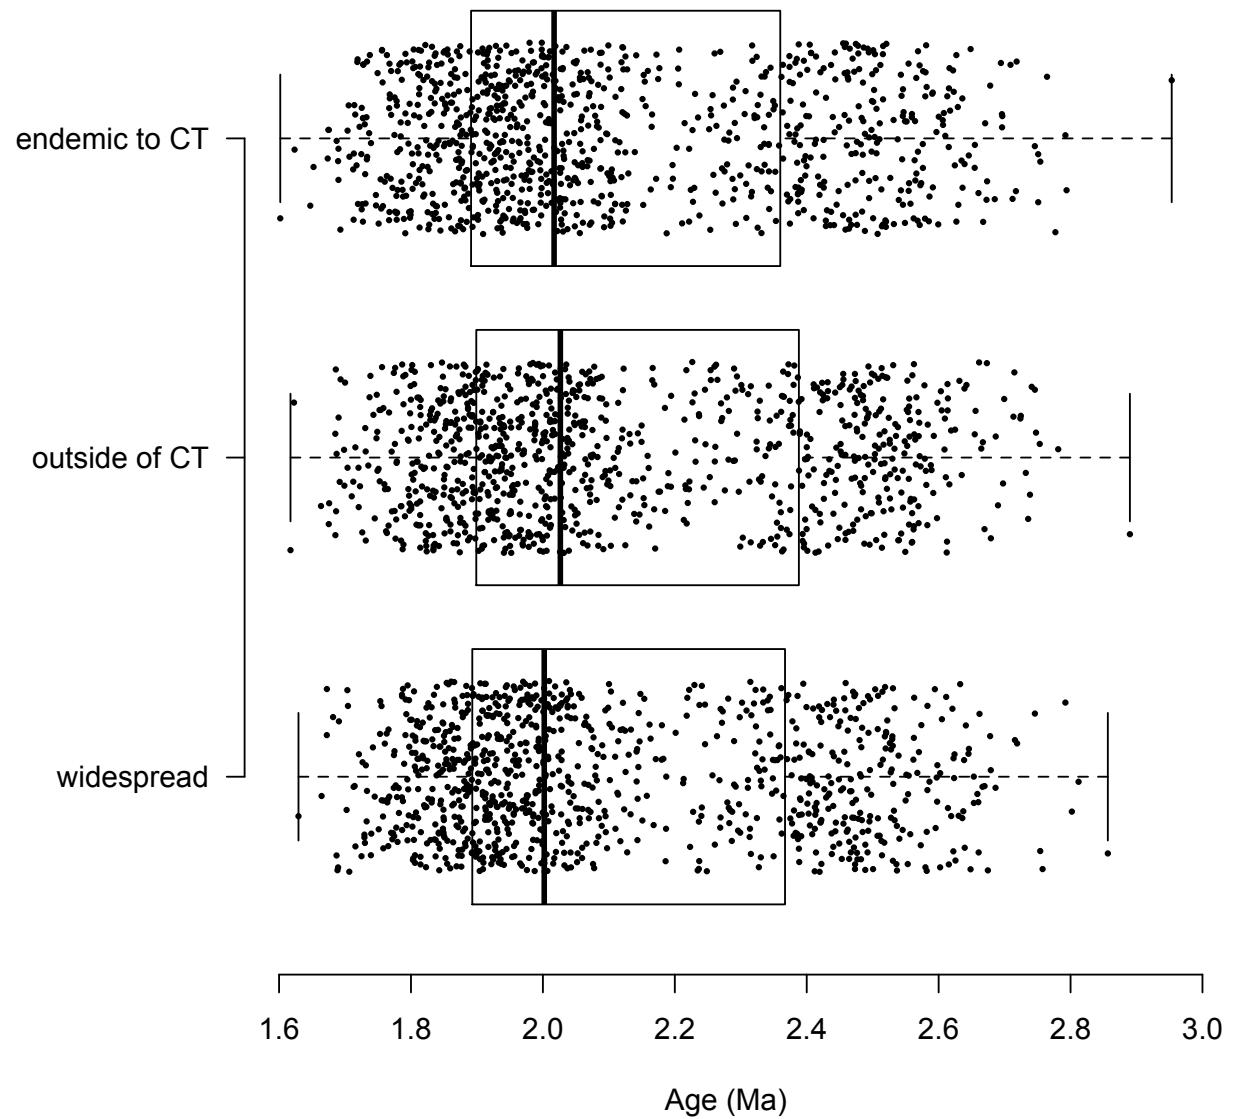

Figure S4: Species ages based on phylogenetic tip length of CT, non-CT, and widespread species for neutral traits simulated without regional differences in speciation, extinction, or dispersal (analysis #9).

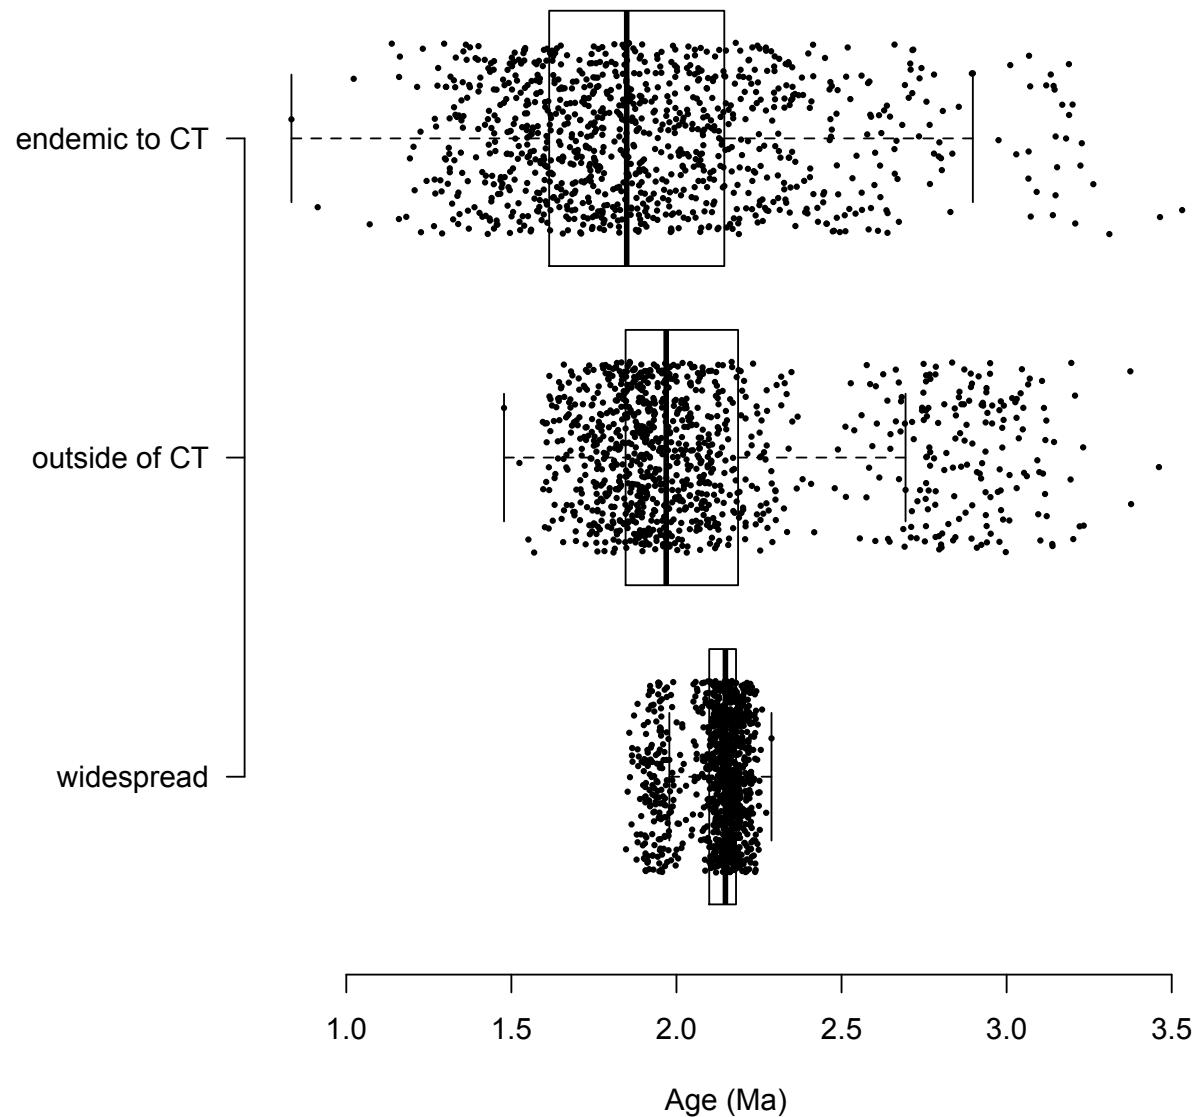

Figure S5: Species ages based on phylogenetic tip length of CT, non-CT, and widespread species for neutral traits obtained by fitting real geographic states to the three-state Mk model (analysis #10).

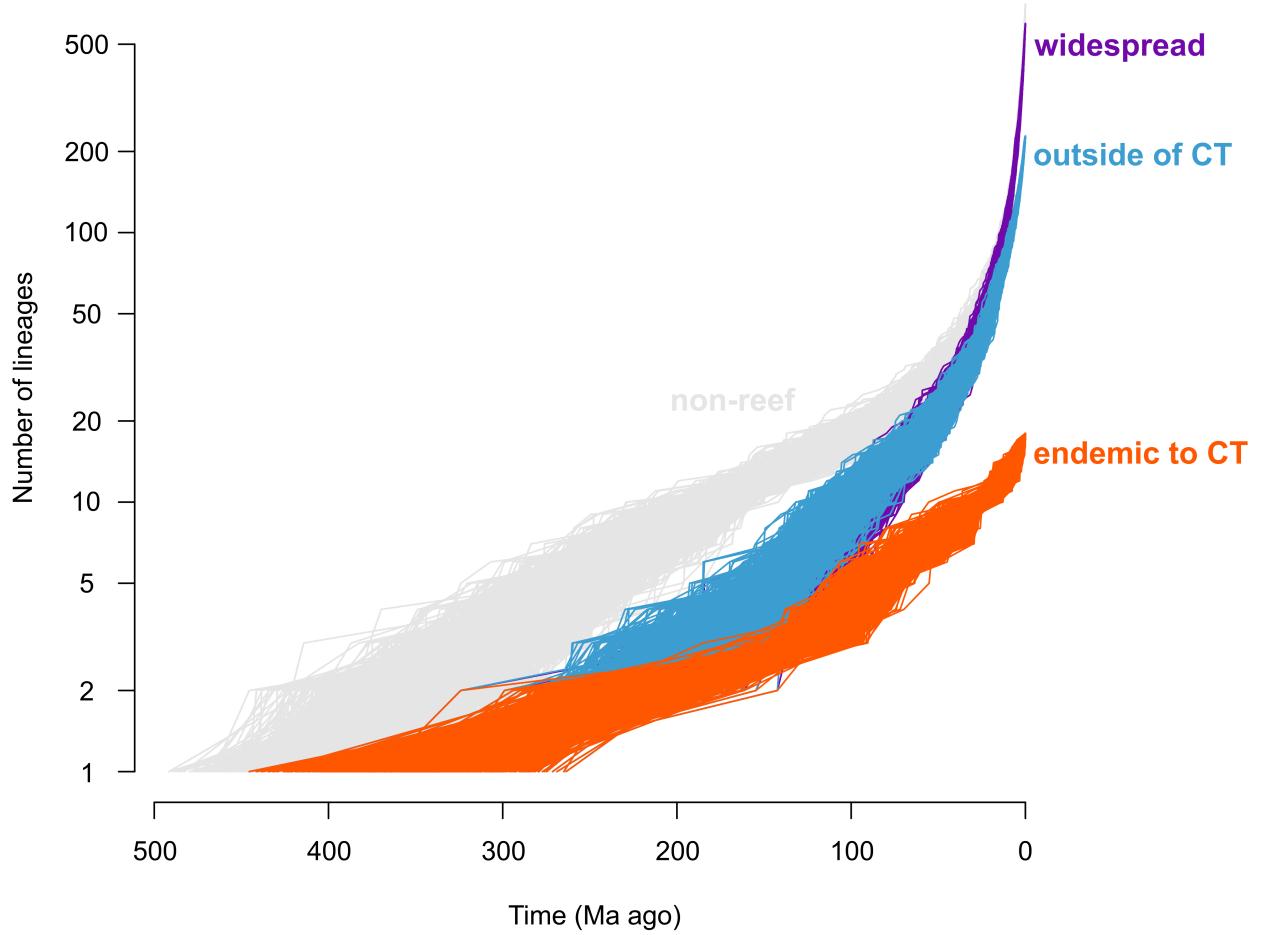

Figure S6: Lineages-through-time plots partitioned by region for all scleractinian corals.

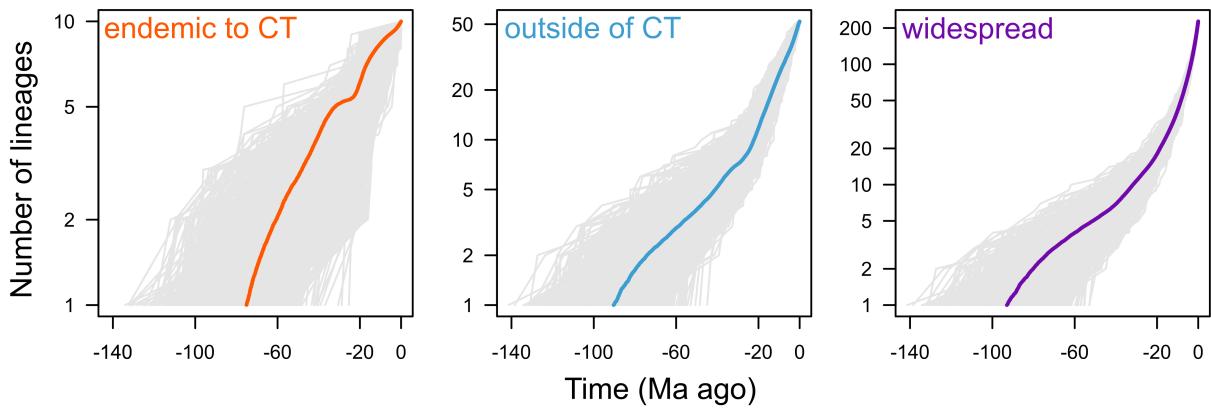

Figure S7: Averaged lineages-through-time plot of each region compared to 1000 sets of shuffled geographic states (gray).

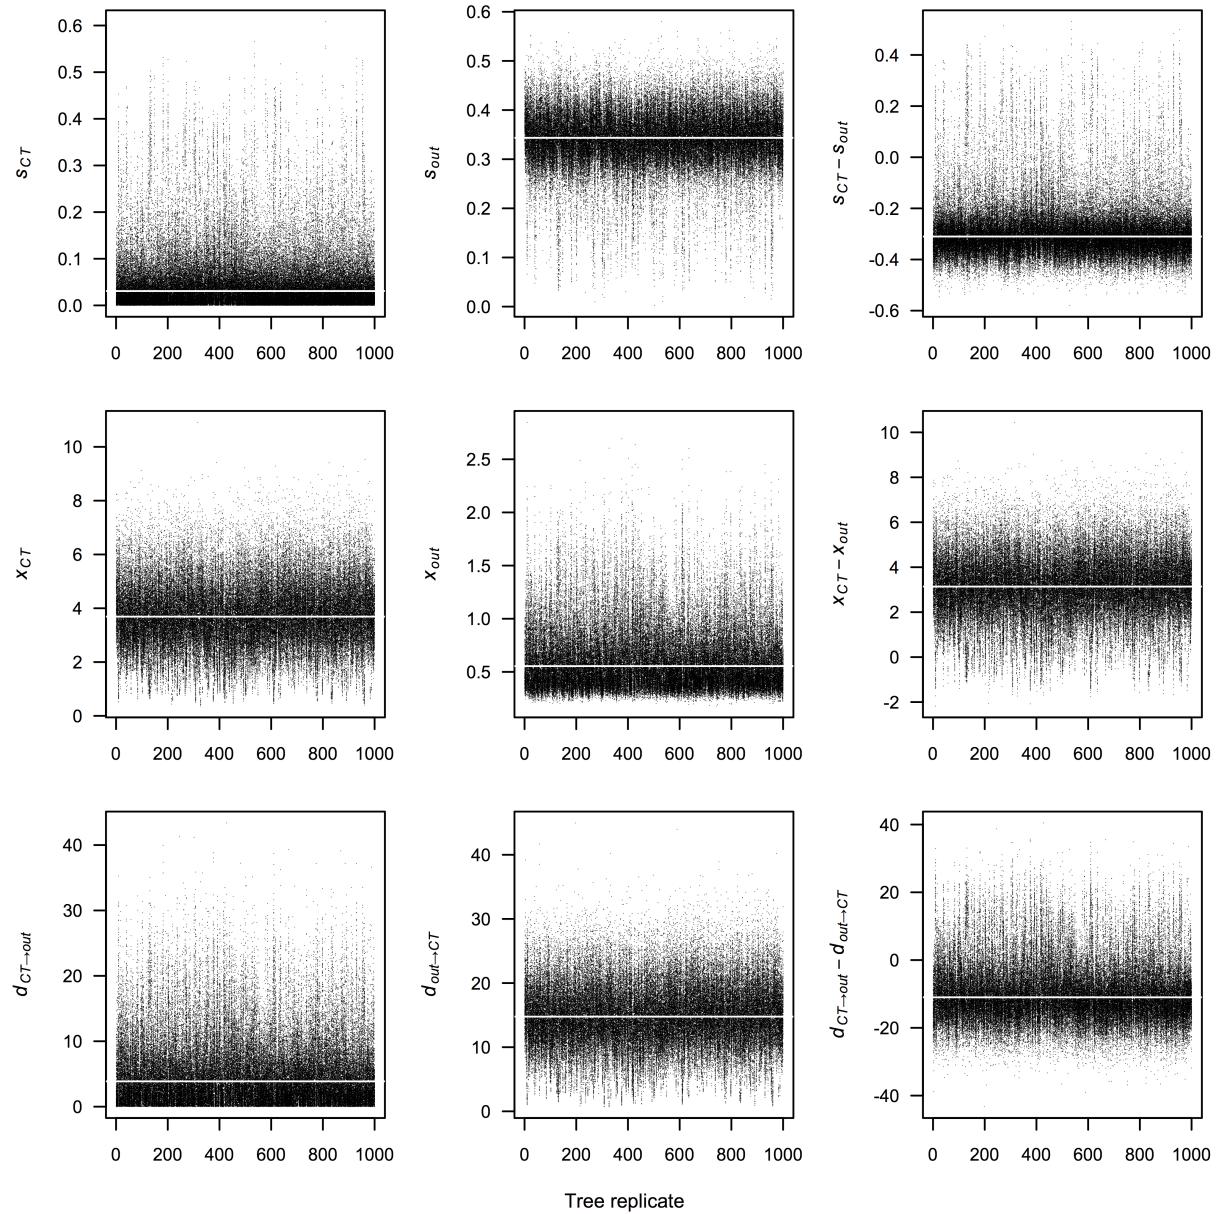

Figure S8: GeoSSE estimated parameters computed with MCMC for 1000 randomly resolved trees, showing variability among trees (1000 steps per tree) for analysis #1 (CT vs. out).

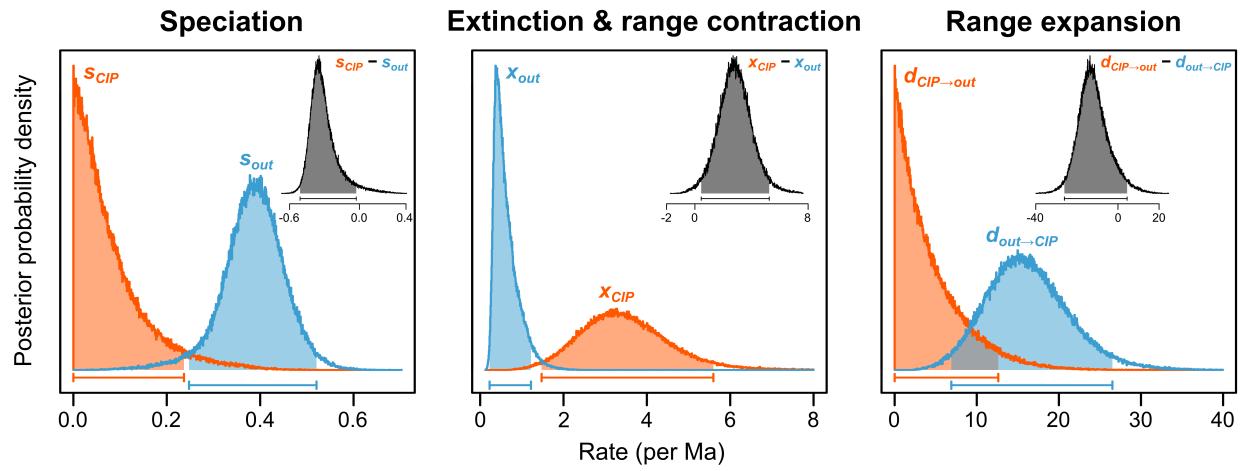

Figure S9: GeoSSE parameter estimates computed with MCMC for Acroporid trees in analysis #2 (CIP vs. out).

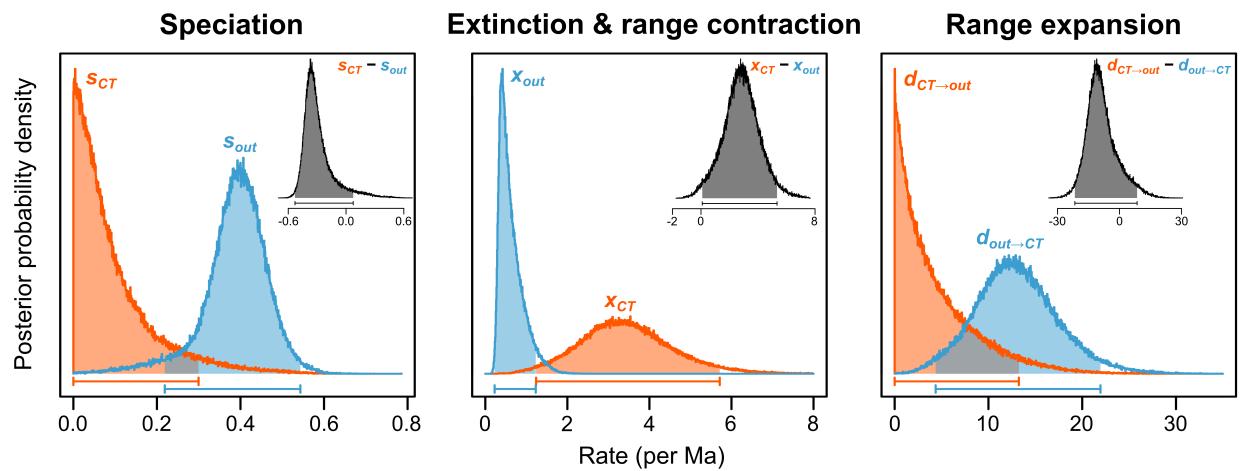

Figure S10: GeoSSE parameter estimates computed with MCMC for Acroporid trees based on the Coral Geographic in analysis #3.

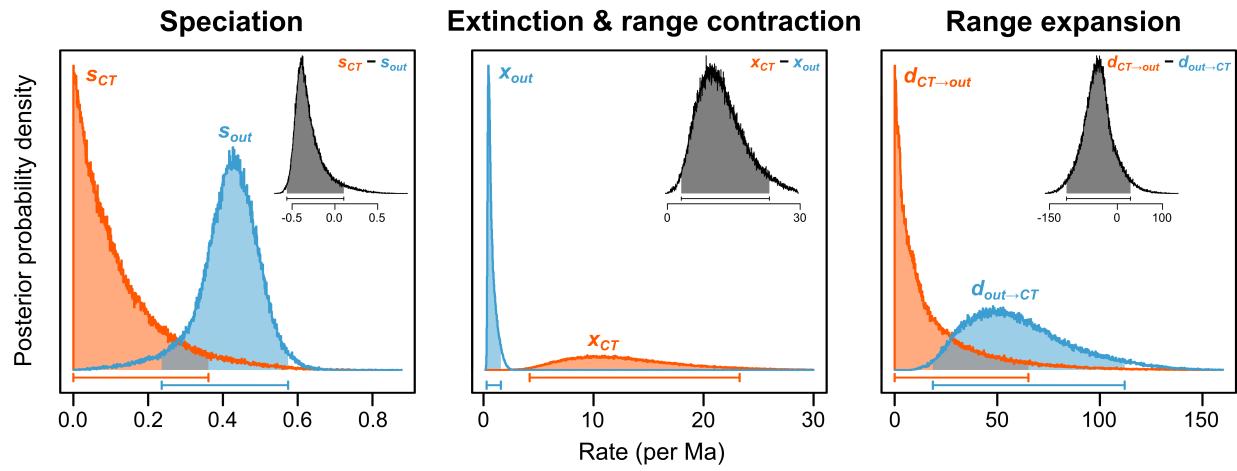

Figure S11: GeoSSE parameter estimates computed with MCMC for Acroporidæ trees based on a broad uniform prior (rates between 0 and 100/Ma) in analysis #4.

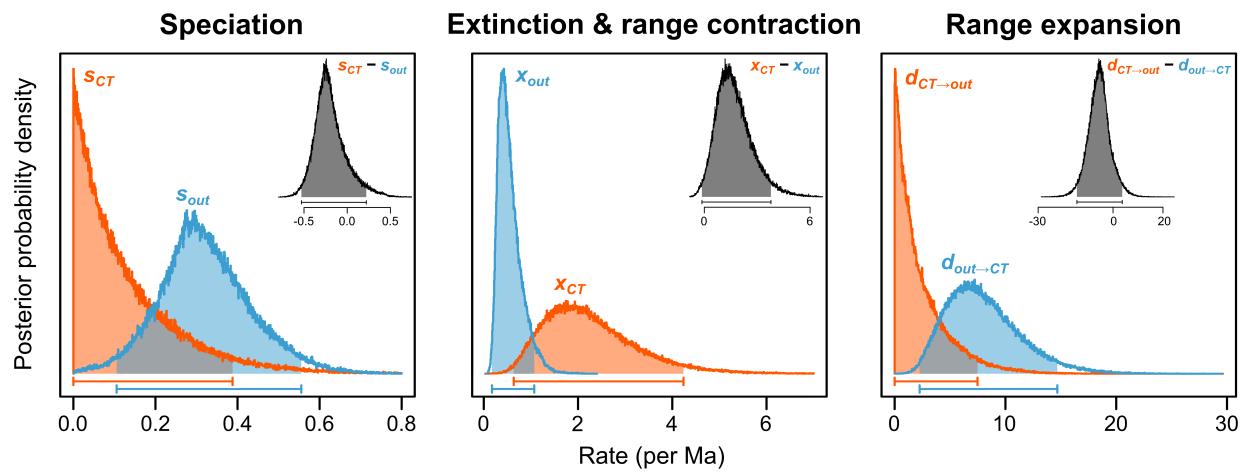

Figure S12: GeoSSE parameter estimates computed with MCMC for posterior trees based on Acroporidæ molecular data in analysis #5.

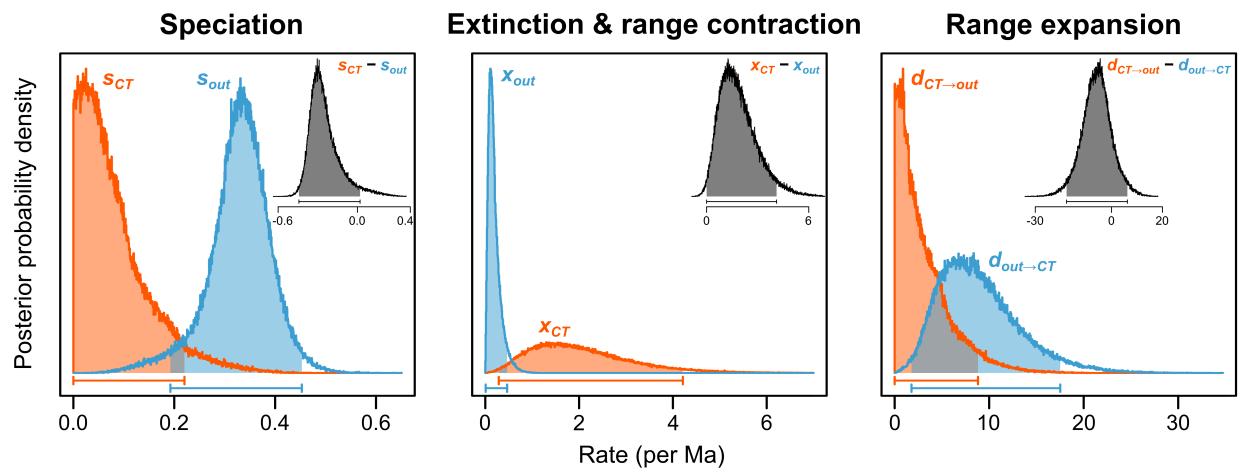

Figure S13: GeoSSE parameter estimates computed with MCMC for trees of the clade *Acropora + Isopora* in analysis #6.

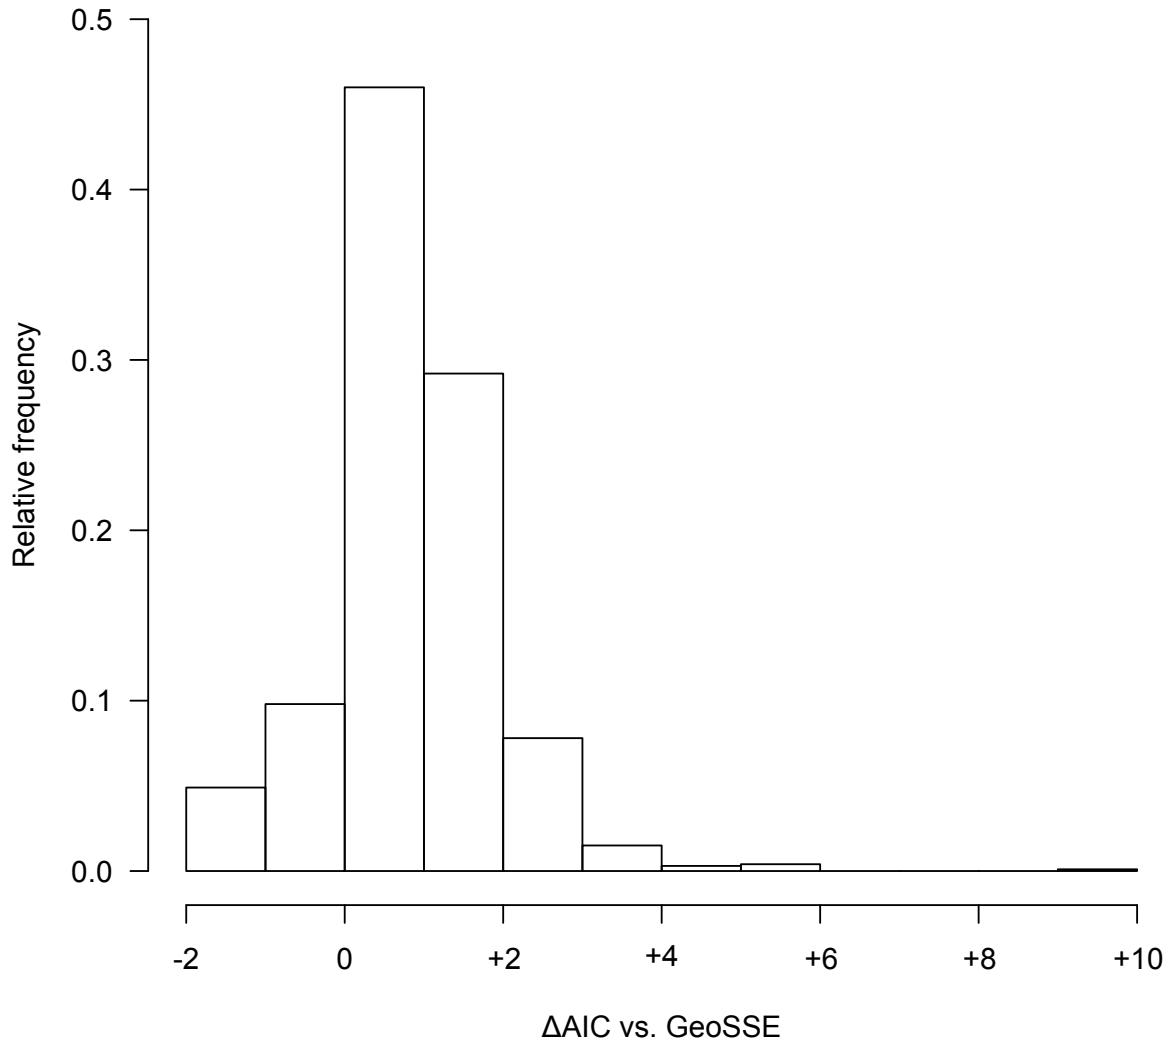

Figure S14:  $\Delta\text{AIC}$  of the character-independent model in which rates of speciation and extinction do not depend on geographic range, compared against the GeoSSE model (Fig. S2).

**Table S1.** List of 1547 species used to reconstruct the phylogeny of Scleractinia, detailing GenBank accession numbers—for 12S ribosomal RNA (12S), 16S ribosomal RNA (16S), ATP synthase F0 subunit 6 (AT6), cytochrome c oxidase subunit I (COI), control region (CTR), cytochrome b (CYB), NADH dehydrogenase subunit 5 (ND5), internal transcribed spacers 1 and 2 (ITS), and Pax-C (PAC)—as well as morphological data sources. Remarks list taxonomic and geographic data sources, other than Hughes et al. (2013) and the Coral Geographic (Veron et al. 2009, 2011).
